Kyron Engineering

// KYRON ENGINEERING TECHNOLOGY SOLUTIONS

Technology built for independence.

We build, you own. We design, build and maintain software, system integrations and automation for businesses that want their technology to support the way they operate, then transfer full ownership to the business.

2026 www.kyronengineering.com

// AT A GLANCE

Diagnostic. Fifteen business days, fixed fee, all outputs yours.

Engagements. Five models, from a single project to an assigned team.

Ownership. Source code, documentation and plans transfer to you.

No vendor lock-in.

No hidden dependencies.

Executive Summary

Kyron Engineering helps businesses get more out of their technology by building, connecting and maintaining the systems they rely on every day. We work with companies whose growth has outpaced their current tools, whether that means too much manual work, systems that do not share information, or plans for a new application without the team to build it.

We recommend beginning with a 15-business-day, fixed-fee Technology Diagnostic, which gives your leadership team a clear picture of where your technology stands, the main risks, and a prioritised plan for the next 12 months.

From there, we can deliver the recommended work as a defined project, support it on an ongoing basis, or hand it over to your own team or another provider. In every engagement, the source code, documentation and plans belong to you upon full payment.

1 Introduction

Kyron Engineering is a technology services company based in Indonesia. We design, build and maintain software, system integrations and automation for businesses that need technology to support the way they operate.

You do not need an internal IT department to work with us. We can take full responsibility for a solution, from planning through to ongoing support, or work alongside your existing technical team.

This proposal sets out the services we provide, our working method and the commercial options available.

Three measurable commitments govern how we work. We stay until the system meets its agreed acceptance criteria. The knowledge stays with your business, through complete documentation and access to everything we build. And the handover is proven, with your team or chosen provider demonstrating that they can operate the system without us.

2 Where we can help

As a business grows, its technology needs to keep pace. These are the areas where companies most often ask for our support:

- **Reducing repetitive manual work,** such as re-entering data or preparing reports by hand.
- **Connecting the applications your teams use,** so that sales, finance, inventory and operations work from the same figures.
- **Providing timely, reliable management reporting** that is ready when decisions need to be made.
- **Improving or replacing applications** that have become difficult to maintain.
- **Delivering a new application, customer portal or AI tool** without the need to build an internal team.

Whichever of these applies to your business, our aim is to save time and cost, improve accuracy and visibility, and support your next stage of growth.

3 Our services

Our work covers six service areas. Most engagements draw on two or three of them, depending on the requirement.

SERVICE	DESCRIPTION	EXAMPLES
Custom software	Applications and systems built to your requirements where packaged software is not suitable.	Web and mobile applications, customer and staff portals, booking systems, internal dashboards
Process automation	Automation of routine tasks to reduce manual effort and errors.	Digital approval workflows, scheduled reports, automated data entry, document handling
System integration	Connecting existing applications so that information moves between them automatically.	Linking POS, accounting, CRM, inventory and e-commerce platforms
Data and reporting	Consolidating business data into a single, reliable source for management reporting.	Management dashboards, consolidated sales and stock reporting
System modernisation	Phased improvement or replacement of older systems with minimal disruption to operations.	Cloud migration, application redevelopment, new functionality around existing systems
Artificial intelligence	Design and implementation of AI where it offers a clear operational benefit.	Customer service assistants, document reading and data extraction, internal knowledge search

We recommend AI only where it offers a clear and measurable benefit. In many cases, well-designed automation and integration achieve the same result more simply. Where an existing commercial product meets the requirement, we will recommend it and manage its configuration and integration.

4 Our approach

Each engagement follows four stages. A review point at the end of every stage lets you confirm progress and decide whether to continue.

01 **Assessment.** We review how the business operates, meet the people involved, and examine current systems, processes and data.

02 **Planning.** We recommend what should be built, integrated, automated or purchased, with a defined scope, timeline and budget.

03 **Delivery.** We develop the solution in short phases with regular progress reviews, test it with your users, and introduce it into daily operations with training and documentation.

04 **Support.** We maintain the solution, resolve issues and implement improvements as the business develops. Where you have an internal team, we can arrange a structured handover instead.

4.1 Technology Diagnostic

If your requirements are not yet fully defined, we recommend starting with a Technology Diagnostic. It is completed in 15 business days for a fixed fee.

DAYS	ACTIVITY
1–2	Kick-off: confirm priorities, arrange access and meet key system users
3–9	Review of systems, data and processes, with short interviews across the team
10–13	Analysis of risks, opportunities and recommended actions
14	Presentation of findings to management and the wider team
15	Decision on the next stage

The Diagnostic provides an assessment of the current position, a register of key risks, a prioritised 90-day action plan and a 12-month roadmap. All outputs belong to you, and you may act on them with Kyron Engineering, internally or with another provider.

4.2 Ownership over the engagement

Day-to-day control shifts to the business stage by stage. Ongoing support is a choice, never a requirement. The split below is illustrative.

PHASE	KYRON ENGINEERING	CLIENT	WHAT CHANGES
Baseline Diagnostic	90%	10%	We map systems, data flows and integrations, rank risks and deliver the roadmap.
Joint Engineering	70%	30%	We build to an agreed scope in short phases; your team reviews and tests.
Shared Operations	40%	60%	We run and improve the system with your team, with documentation and training.
Autonomous Ownership	10%	90%	A transfer checklist is walked through; your team or another provider takes over.

5 Technical overview

Architecture

We favour integrating and extending existing systems over replacing them. New capabilities are delivered behind an integration layer (REST and GraphQL APIs, event-driven synchronisation and middleware) that connects ERP, CRM, POS, finance and legacy applications to a shared data layer and new applications. Replacement is recommended only where the Diagnostic identifies a clear lifecycle-cost or risk case.

Technology stack

We work with a standard, widely supported stack so that solutions remain maintainable by any competent team. Deviations are recorded in an architecture decision record covering the rationale, lifecycle cost, owner and exit path, and require your approval.

LAYER	DEFAULT
Frontend	Next.js (React); Vue 3 where justified
Backend	NestJS (TypeScript); Python for data and machine-learning workloads
Database	Managed PostgreSQL with Prisma
Analytics	BigQuery, warehouse-first
Infrastructure	Google Cloud (Cloud Run and managed services); AWS or Azure where the client environment requires
AI	Provider-neutral model selection based on quality, privacy, latency and cost

Tools in use

The list below is our working bench, not a shopping list: each project uses the subset the requirement justifies.

Astro · Next.js · Vue · Vite · Tailwind CSS · Bootstrap

Node.js · NestJS · Fastify · Express.js · PostgreSQL · Supabase

Neon · Snowflake · BigQuery · Google Cloud · Cloudflare · Render

Railway · Docker · Snyk · Semgrep · Veracode · Strix AI

Claude · Gemini · ChatGPT · DeepSeek · GLM · NVIDIA

Delivery and operations

CI/CD pipelines, infrastructure as code, containerised deployment, and separate development, staging and production environments. Monitoring, logging, alerting, backup and recovery procedures are in place before go-live.

Security and data protection

Access follows the principle of least privilege. Diagnostic access is read-only and revoked on completion. Client data is not shared with any AI provider without written approval of its use, storage and location. Processing of personal data is reviewed against Law No. 27 of 2022 on Personal Data Protection (UU PDP) for each project.

AI governance

Each AI feature has a named owner, an evaluation suite to measure output quality, an agreed cost budget, and the ability to be switched off with a fallback to the standard process.

Ownership

Source code, architecture documentation and Diagnostic outputs are owned by the client, with full repository access and technical documentation provided.

6 Engagement options

We offer five engagement models. Many clients begin with the Technology Diagnostic and then continue under one of the other arrangements.

MODEL	SUITABLE WHEN	SCOPE	COMMERCIAL BASIS
Technology Diagnostic	Priorities have not yet been defined	Assessment, risk review, 90-day action plan and 12-month roadmap, delivered in 15 business days	Fixed fee: IDR [amount]
Project	The requirement is clearly defined	Design, development and launch of a solution to an agreed scope and timeline	Fixed price per agreed scope
Technology retainer	Development, support and advice are needed on an ongoing basis	A monthly allocation of team time for enhancements, fixes and technical advice	Monthly retainer
Managed services	Systems need to be maintained without an internal IT team	Monitoring, maintenance, security updates and user support	Monthly fee based on scope and service level
Dedicated team	There is a substantial roadmap or a digital product in development	An assigned Kyron Engineering team working to your priorities	Monthly, based on team size

Fees are confirmed in writing once scope has been agreed. The Diagnostic is invoiced [50% at kick-off and 50% on presentation of findings], and there is no obligation to proceed further.

7 Why Kyron Engineering

We begin with your business needs rather than a preferred technology, and design each solution around how your organisation works. Where possible, we improve and connect the systems you already have instead of replacing them.

Engagements are structured in defined stages with agreed scopes and regular reporting, so you retain control over cost and direction. Upon full payment, the source code, documentation and plans belong to you.

Both founders are directly involved in every engagement: one is accountable for the client relationship and delivery, the other for architecture and technical quality. After launch, we can continue to support and develop the solution, or transfer it to your team or chosen provider. Ongoing support is always your choice.

7.1 Our commitments

COMMITMENT	WHAT IT MEANS	HOW WE PROVE IT
We stay until it runs smoothly	We do not leave at launch. We monitor the system, fix issues fast and keep improving it.	Service recovery time, tracked from day one
Knowledge stays with the business	Every system comes with clear documentation and guides, so the know-how belongs to the business.	Documentation reviewed and signed off at every stage
The right tools, not the trendy ones	We recommend what the business actually needs; often the simplest option is the best value.	Every recommendation carries its cost and expected return
A transfer that actually works	Whoever takes over, whether in-house staff or another provider, is walked through running and fixing the system.	A transfer checklist, agreed in the contract

7.2 Principles

01 **Keep it simple.** No extra complexity until there is a real reason for it.

02 **Running it is part of the job.** Monitoring, backups, cloud costs and recovery plans are included, not extras.

03 **Clear communication.** Plain-language updates and no jargon, so decision-makers always know where things stand.

04 **Standard, proven technology.** Widely used, well-supported tools, so any qualified engineer can pick the system up.

05 **Security from day one.** Access controls, encryption and regular updates are built in, not added later.

7.3 How we measure progress

No vague status reports. We measure these on every project and report them in plain language. The first four are the industry-standard DORA metrics used by top engineering teams.

METRIC	WHAT IT TELLS YOU
Lead time	How long a change takes to go live
Release frequency	How often updates go live
Change failure rate	How often an update causes a problem
Recovery time	How fast service is restored after an issue
Rework rate	How much work has to be redone
Uptime	How much of the time the system is available
Response time	How quickly support requests are answered
Transfer readiness	How complete the documentation and transfer checklist are

8 Next steps

01 **Introductory meeting.** A 30 to 45 minute discussion of your business and priorities.

02 **Scope confirmation.** e provide a written scope and fixed fee for the Diagnostic or your project.

03 **Kick-off.** Work begins within 15 business days of written approval.

To arrange an introductory meeting, please get in touch with us.
